8	Conclusion	3

1. Introduction

The **Campus Lost & Found Portal** is a web application designed to help students and staff report lost items and browse found items posted by others. It solves a common everyday problem on any campus or institution where items get misplaced and there is no organized way to reunite them with their owners.

The application will be built using **HTML, CSS, ASP.NET MVC, and C#**, covering the full course technology stack.

2. Problem Statement

When someone loses an item on campus, they have no easy way to check if it has been found and handed in somewhere. Similarly, someone who finds an item has no reliable way to reach its owner. Currently people rely on notice boards or word of mouth, which is slow and ineffective. This portal provides a centralized, searchable solution to this problem.

3. Objectives

- Allow users to register and log in to the portal.
- Let users post a lost item or a found item with details and an optional photo.
- Allow anyone to browse and search posted items by category or location.
- Let a user mark an item as returned/resolved once it is claimed.
- Build the application using ASP.NET MVC, C#, HTML, and CSS.

4. Key Features

- **User Registration & Login** — secure accounts using ASP.NET Identity.
- **Post Lost Item** — title, description, date lost, location, category (e.g. bag, phone, keys), optional image upload.
- **Post Found Item** — same fields but from the finder's perspective.
- **Browse & Search** — view all active posts, filter by category or location keyword.
- **Mark as Resolved** — the post owner can close a listing once the item is returned.
- **My Posts** — a personal page showing only the logged-in user's listings.

5. Technology Stack

Layer	Technology
Front-End	HTML5, CSS3, Razor Views (.cshtml)
Back-End	ASP.NET MVC 5, C#
Database	SQL Server LocalDB, Entity Framework
Auth	ASP.NET Identity
IDE	Visual Studio 2022

6. Project Timeline

Week	Task
1	Project setup, database design, Git repository
2	User registration and login (ASP.NET Identity)
3	Lost & Found item model and CRUD operations
4	Browse, search, and filter functionality
5	Image upload and My Posts page
6	Mark as resolved feature and UI styling
7	Testing and bug fixes
8	Final review and submission

7. Work Distribution

Name	ID	Responsibility
Mohyuddiin	65405	Back-end: Controllers, routing, ASP.NET Identity, C# logic
Zain Imran	65495	Database: EF models, migrations, CRUD operations
Shahzaman Khan	64930	Front-end: HTML/CSS views, Razor templates, UI design

8. Conclusion

The Campus Lost & Found Portal is a practical and unique web application that addresses a real problem students face every day. It is straightforward enough to build within the course timeframe while covering all required technologies: HTML, CSS, ASP.NET MVC, and C#. The project involves user authentication, database interaction, image handling, and a clean searchable interface, making it a well-rounded intermediate-level course project.
